Statements and Declarations

Funding. The author declares that no funds, grants, or other support were received during the preparation of this manuscript.

Competing interests. The author declares no competing interests.

Author contributions. Yongzhi Li made the principal contribution to this work and read and approved the final manuscript.

Acknowledgements. The author has no acknowledgements to declare.

Ethics approval. Not applicable. This study used numerical simulations and publicly released non-human flight records and involved neither human participants nor animals.

Consent to participate. Not applicable.

Consent for publication. Not applicable.

Data and code availability. Controlled-system trajectories can be regenerated with the differential-equation and experiment code supplied in the reproducibility materials. The external evaluation uses the NanoDrone dataset authors' publicly released, offline-preprocessed flight-state records. To preserve the upstream distribution terms, third-party flight files are not redistributed. The supporting materials include data-retrieval information and SHA-256 checksums together with configurations, seeds, split identifiers, saved predictions, metrics, and analysis scripts. The code and reproducibility materials are publicly available at `https://github.com/chnoorlee/ComplementaryFilteredResidualWorldModelsforRecedingHorizonControlofNonlinearSystems`. An archived release will be deposited in Zenodo and cited by its persistent identifier in the final version.
